FASHION OPERATIONS SOFTWARE

ATELIER

Fashion Collection & Stockroom Portal

THE PROBLEM

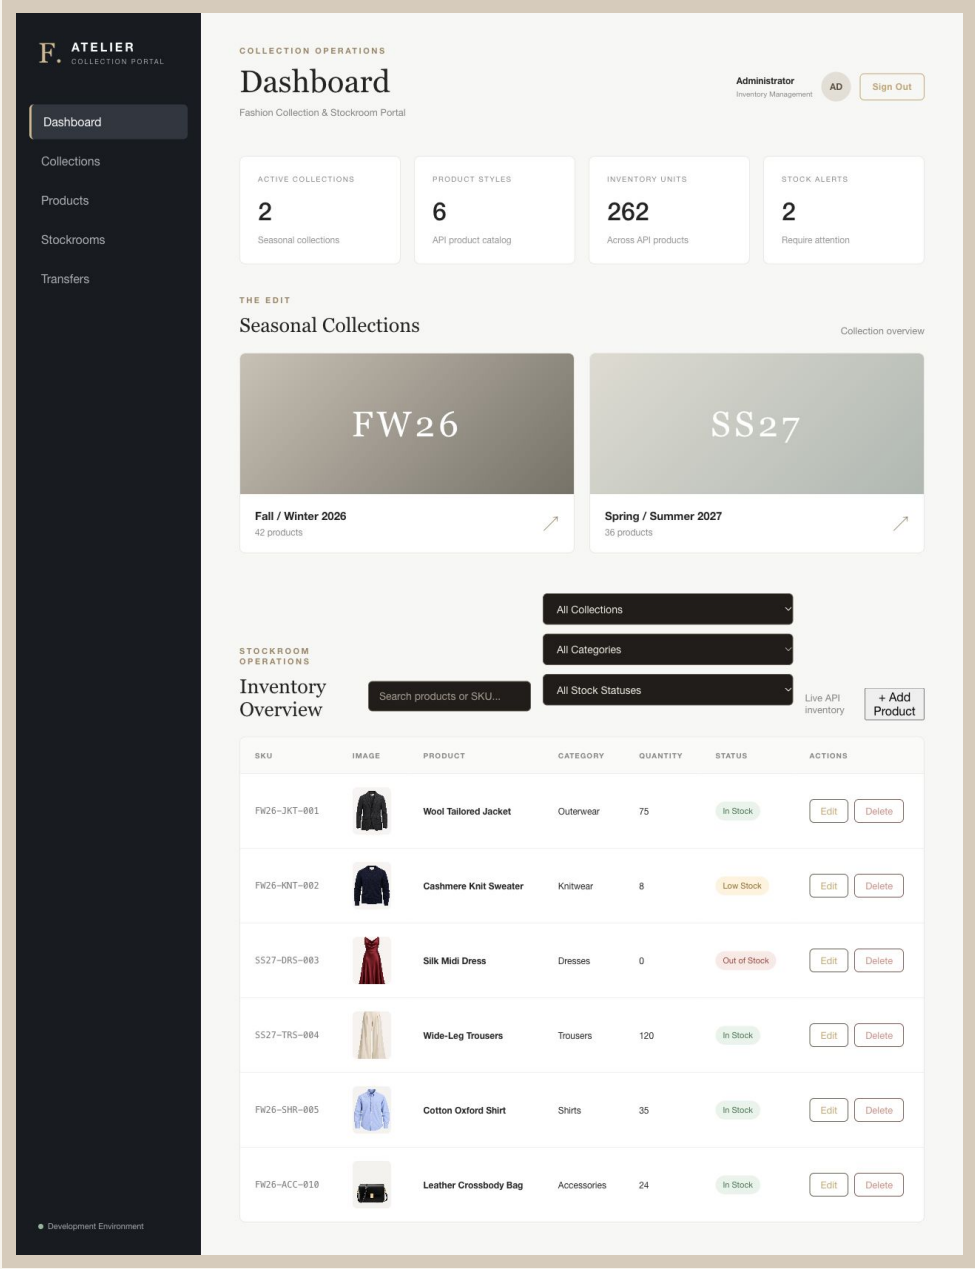

When product records, images and stock counts sit in separate places, staff have to cross-check sources to understand what is on hand.

THE SOLUTION

ATELIER brings inventory records, product imagery and stock indicators into one role-aware workspace. Seasonal cards give the dashboard collection context using mock data.

PROJECT SCOPE

A full-stack portfolio project demonstrating fashion inventory workflows in a development environment.

Portfolio screenshot / Administrator dashboard

Inside the stockroom

The dashboard puts stock indicators and seasonal context above the product records staff work with.

CORE FEATURES

Inventory management

Create, view, edit and delete product records according to role. Search by product name or SKU and narrow the list with filters.

Product imagery

Administrators and inventory managers can upload validated product photos through the API. The dashboard displays thumbnails and has no upload control.

Inventory KPIs

Review product style counts, inventory units and stock alerts from the dashboard. The inventory table shows quantities and stock status.

Seasonal collections

Preview seasons through collection cards. The cards use mock data to demonstrate the collection layout and presentation.

TYPICAL WORKFLOW

01 **Review stock**
Open the dashboard and check the inventory totals and stock alerts.

02 **Find a product**
Search by name or SKU, then review the image, quantity and stock status.

03 **Maintain the record**
With write access, add or edit products. Administrators can also delete them.

How ATELIER is built

A React interface presents stockroom workflows. FastAPI handles inventory and image upload requests, while Supabase provides data, identity and file storage.

ARCHITECTURE & TECHNOLOGY STACK

01

Frontend

React / TypeScript / Vite

Dashboard, inventory table, product forms and image display.

02

Backend

FastAPI

Inventory CRUD and product image upload API.

03

Data & identity

Supabase

PostgreSQL for inventory records, Auth for sign-in and Storage for product images.

SECURITY & ROLE-BASED ACCESS

Supabase Auth handles sign-in. FastAPI verifies access tokens and enforces role permissions on product operations.

administrator	View, create, edit and delete products.
inventory_manager	View, create and edit products.
viewer	View inventory only.

PORTFOLIO VALUE

ATELIER demonstrates how a fashion operations interface connects to typed frontend code, inventory APIs, persistent records, image storage and role-aware workflows.
